Gaussian autoregressive model

Consider autoregressive model

$$p(\mathbf{x}|\boldsymbol{\theta}) = \prod_{i=1}^m p(x_i|\mathbf{x}_{1:i-1}, \boldsymbol{\theta}),$$

with conditionals

$$p(x_i|\mathbf{x}_{1:i-1}, \boldsymbol{\theta}) = \mathcal{N}(\hat{\mu}_i(\mathbf{x}_{1:i-1}), \hat{\sigma}_i^2(\mathbf{x}_{1:i-1})).$$

Forward and inverse

$$x_i = \hat{\sigma}_i(\mathbf{x}_{1:i-1}) \cdot z_i + \hat{\mu}_i(\mathbf{x}_{1:i-1}), \quad z_i \sim \mathcal{N}(0, 1).$$

$$z_i = (x_i - \hat{\mu}_i(\mathbf{x}_{1:i-1})) \cdot \frac{1}{\hat{\sigma}_i(\mathbf{x}_{1:i-1})}.$$

Gaussian autoregressive model

Forward and inverse

$$\mathbf{x} = g(\mathbf{z}, \theta); \quad x_i = \hat{\sigma}_i(\mathbf{x}_{1:i-1}) \cdot z_i + \hat{\mu}_i(\mathbf{x}_{1:i-1}), \quad z_i \sim \mathcal{N}(0, 1).$$

$$\mathbf{z} = f(\mathbf{x}, \theta); \quad z_i = (x_i - \hat{\mu}_i(\mathbf{x}_{1:i-1})) \cdot \frac{1}{\hat{\sigma}_i(\mathbf{x}_{1:i-1})}.$$

Jacobian

$$\log \left| \det \left(\frac{\partial f(\mathbf{x}, \theta)}{\partial \mathbf{x}} \right) \right| = - \log \left| \det \left(\frac{\partial g(\mathbf{z}, \theta)}{\partial \mathbf{z}} \right) \right| = - \sum_{i=1}^m \log \hat{\sigma}_i(\mathbf{x}_{1:i-1}).$$

We get an autoregressive model with tractable (triangular) Jacobian, which is easily invertible. It is a flow!

Inverse autoregressive flow (IAF)

Gaussian autoregressive model ($\mathbf{z} \rightarrow \mathbf{x}$)

$$x_i = \hat{\sigma}_i(\mathbf{x}_{1:i-1}) \cdot z_i + \hat{\mu}_i(\mathbf{x}_{1:i-1}).$$

$$z_i = (x_i - \hat{\mu}_i(\mathbf{x}_{1:i-1})) \cdot \frac{1}{\hat{\sigma}_i(\mathbf{x}_{1:i-1})}.$$

This process is sequential.

Let use the following reparametrization: $\sigma = \frac{1}{\hat{\sigma}}$; $\mu = -\frac{\hat{\mu}}{\hat{\sigma}}$.

Inverse transform ($\mathbf{x} \rightarrow \mathbf{z}$)

$$z_i = \sigma_i(\mathbf{x}_{1:i-1}) \cdot x_i + \mu_i(\mathbf{x}_{1:i-1}).$$

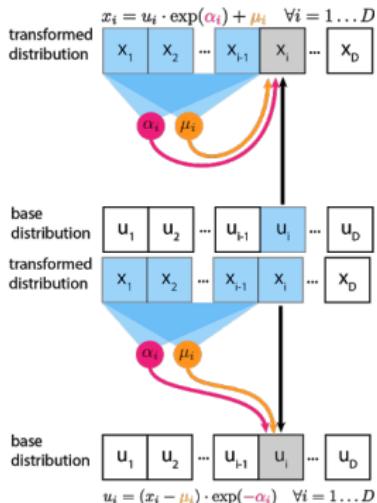

$$x_i = (z_i - \mu_i(\mathbf{x}_{1:i-1})) \cdot \frac{1}{\sigma_i(\mathbf{x}_{1:i-1})}.$$

This process is **not** sequential.

Inverse autoregressive flow (IAF)

Gaussian autoregressive model

$$x_i = \hat{\sigma}_i(\mathbf{x}_{1:i-1}) \cdot z_i + \hat{\mu}_i(\mathbf{x}_{1:i-1}).$$

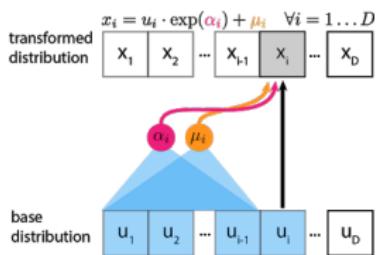

Inverse transform

$$z_i = (x_i - \hat{\mu}_i(\mathbf{x}_{1:i-1})) \cdot \frac{1}{\hat{\sigma}_i(\mathbf{x}_{1:i-1})};$$

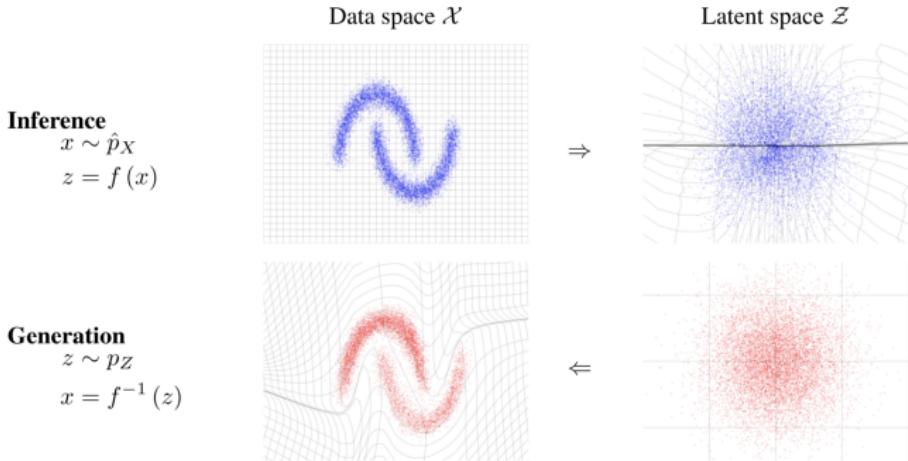

$$z_i = \sigma_i(\mathbf{x}_{1:i-1}) \cdot x_i + \mu_i(\mathbf{x}_{1:i-1}).$$

Inverse autoregressive flow

$$x_i = \sigma_i(\mathbf{z}_{1:i-1}) \cdot z_i + \mu_i(\mathbf{z}_{1:i-1}).$$

Flows

- ▶ Inference mode in autoregressive flows is used for density estimation task.
 - ▶ Generation mode in autoregressive flows (IAF) is used for stochastic variational inference to get more flexible posterior distribution.

Inverse autoregressive flow (IAF)

Inverse transform ($\mathbf{x} \rightarrow \mathbf{z}$)

$$z_i = \sigma_i(\mathbf{x}_{1:i-1}) \cdot x_i + \mu_i(\mathbf{x}_{1:i-1}).$$

$$x_i = (z_i - \mu_i(\mathbf{x}_{1:i-1})) \cdot \frac{1}{\sigma_i(\mathbf{x}_{1:i-1})}.$$

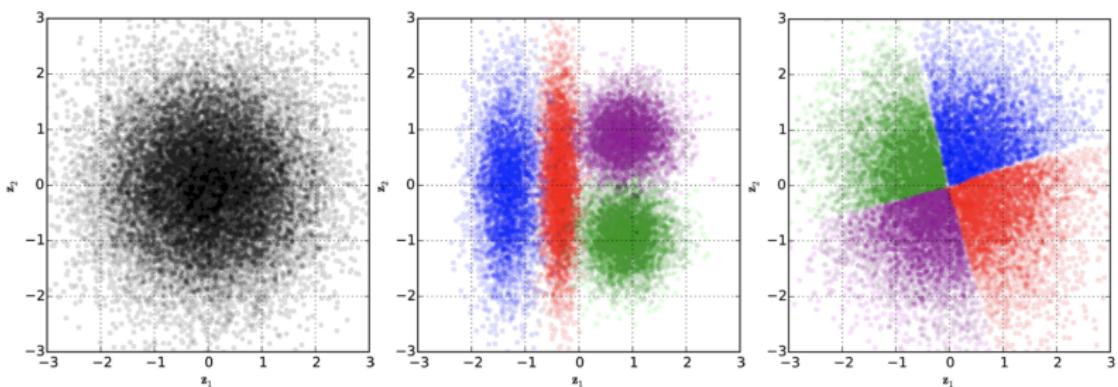

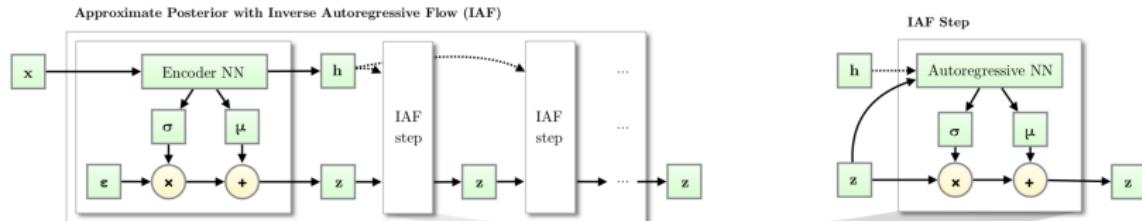

Inverse autoregressive flow use such inverted autoregressive model as a flow in VAE:

$$\mathbf{z}_0 = \sigma(\mathbf{x}) \cdot \epsilon + \mu(\mathbf{x}), \quad \epsilon \sim \mathcal{N}(0, 1); \quad \sim q(\mathbf{z}_0 | \mathbf{x}, \phi).$$

$$\mathbf{z}_k = \sigma_k(\mathbf{z}_{k-1}) \cdot \mathbf{z}_{k-1} + \mu_k(\mathbf{z}_{k-1}), \quad k \geq 1; \quad \sim q_k(\mathbf{z}_k | \mathbf{x}, \phi, \{\phi_j\}_{j=1}^k).$$

<https://arxiv.org/pdf/1606.04934.pdf>

Inverse autoregressive flow (IAF)

(a) Prior distribution

(b) Posteriors in standard VA

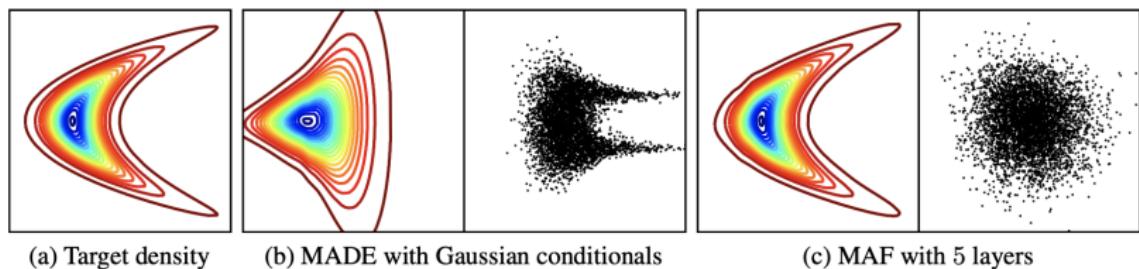

(c) Posteriors in VAE with IAF

Masked autoregressive flow (MAF)

Gaussian autoregressive model

$$p(\mathbf{x}|\theta) = \prod_{i=1}^m p(x_i|\mathbf{x}_{1:i-1}, \theta) = \prod_{i=1}^m \mathcal{N}(x_i|\mu_i(\mathbf{x}_{1:i-1}), \sigma_i^2(\mathbf{x}_{1:i-1})).$$

We could use MADE (masked autoencoder) as conditional model.
The sampling order could be crucial.

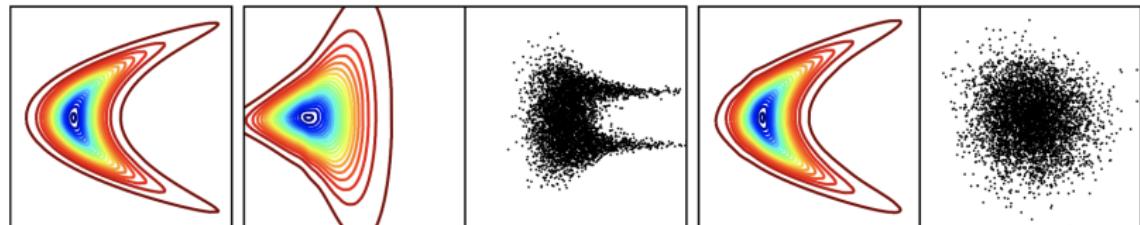

Samples from the base distribution could be an indicator of how good the flow was fitted.

Masked autoregressive flow (MAF)

Gaussian autoregressive model

$$p(\mathbf{x}|\theta) = \prod_{i=1}^m p(x_i|\mathbf{x}_{1:i-1}, \theta) = \prod_{i=1}^m \mathcal{N}(x_i|\mu_i(\mathbf{x}_{1:i-1}), \sigma_i^2(\mathbf{x}_{1:i-1})).$$

(a) Target density

(b) MADE with Gaussian conditionals

(c) MAF with 5 layers

MAF is just a stacked MADE model.

<https://arxiv.org/pdf/1705.07057.pdf>

MAF vs IAF

Sampling and inverse transform in MAF

$$x_i = \hat{\sigma}_i(\mathbf{x}_{1:i-1}) \cdot z_i + \hat{\mu}_i(\mathbf{x}_{1:i-1}).$$

$$z_i = (x_i - \hat{\mu}_i(\mathbf{x}_{1:i-1})) \cdot \frac{1}{\hat{\sigma}_i(\mathbf{x}_{1:i-1})}.$$

- ▶ Sampling is slow (sequential).
- ▶ Density estimation is fast.

Sampling and inverse transform in IAF

$$x_i = \sigma_i(\mathbf{z}_{1:i-1}) \cdot z_i + \mu_i(\mathbf{z}_{1:i-1}).$$

$$z_i = (x_i - \mu_i(\mathbf{z}_{1:i-1})) \cdot \frac{1}{\sigma_i(\mathbf{z}_{1:i-1})}.$$

- ▶ Sampling is fast.
- ▶ Density estimation is slow (sequential).

MAF vs IAF

Theorem

Training a MAF with maximum likelihood corresponds to fitting an implicit IAF with stochastic variational inference where the posterior is taken to be the base density $\pi(\mathbf{z})$:

$$\max_{\theta} p(\mathbf{X}|\theta) \Leftrightarrow \min_{\theta} KL(p(\mathbf{z}|\theta)||\pi(\mathbf{z})).$$

- ▶ $\pi(\mathbf{z})$ is a base distribution; $\pi(\mathbf{x})$ is a data distribution.
- ▶ $\mathbf{z} = f(\mathbf{x}, \theta)$ – MAF model; $\mathbf{x} = g(\mathbf{z}, \theta)$ – IAF model.

$$\log p(\mathbf{z}|\theta) = \log \pi(g(\mathbf{z}, \theta)) + \log \left| \det \left(\frac{\partial g(\mathbf{z}, \theta)}{\partial \mathbf{z}} \right) \right|$$

$$\log p(\mathbf{x}|\theta) = \log \pi(f(\mathbf{x}, \theta)) + \log \left| \det \left(\frac{\partial f(\mathbf{x}, \theta)}{\partial \mathbf{x}} \right) \right|$$

MAF vs IAF

Theorem

Training a MAF with maximum likelihood corresponds to fitting an implicit IAF with stochastic variational inference where the posterior is taken to be the base density $\pi(\mathbf{z})$:

$$\max_{\theta} p(\mathbf{X}|\theta) \Leftrightarrow \min_{\theta} KL(p(\mathbf{z}|\theta)||\pi(\mathbf{z})).$$

Proof

$$\begin{aligned} KL(p(\mathbf{z}|\theta)||\pi(\mathbf{z})) &= \mathbb{E}_{p(\mathbf{z}|\theta)} [\log p(\mathbf{z}|\theta) - \log \pi(\mathbf{z})] = \\ &= \mathbb{E}_{p(\mathbf{z}|\theta)} \left[\log \pi(g(\mathbf{z}, \theta)) + \log \left| \det \left(\frac{\partial g(\mathbf{z}, \theta)}{\partial \mathbf{z}} \right) \right| - \log \pi(\mathbf{z}) \right] = \\ &= \mathbb{E}_{\pi(\mathbf{x})} \left[\log \pi(\mathbf{x}) - \log \left| \det \left(\frac{\partial f(\mathbf{x}, \theta)}{\partial \mathbf{x}} \right) \right| - \log \pi(f(\mathbf{x}, \theta)) \right]. \end{aligned}$$

MAF vs IAF

Proof (continued)

$$\begin{aligned} KL(p(\mathbf{z}|\theta)||\pi(\mathbf{z})) &= \\ &= \mathbb{E}_{\pi(\mathbf{x})} \left[\log \pi(\mathbf{x}) - \log \left| \det \left(\frac{\partial f(\mathbf{x}, \theta)}{\partial \mathbf{x}} \right) \right| - \log \pi(f(\mathbf{x}, \theta)) \right] = \\ &= \mathbb{E}_{\pi(\mathbf{x})} [\log \pi(\mathbf{x}) - \log p(\mathbf{x}|\theta)] = KL(\pi(\mathbf{x})||p(\mathbf{x}|\theta)). \end{aligned}$$

$$\begin{aligned} \arg \min_{\theta} KL(\pi(\mathbf{x})||p(\mathbf{x}|\theta)) &= \arg \min_{\theta} \mathbb{E}_{\pi(\mathbf{x})} [\log \pi(\mathbf{x}) - \log p(\mathbf{x}|\theta)] \\ &= \arg \max_{\theta} \mathbb{E}_{\pi(\mathbf{x})} \log p(\mathbf{x}|\theta) \end{aligned}$$

Unbiased estimator is MLE:

$$\mathbb{E}_{\pi(\mathbf{x})} \log p(\mathbf{x}|\theta) = \sum_{i=1}^n \log p(\mathbf{x}_i|\theta).$$

MAF vs IAF vs RealNVP

MAF

$$\mathbf{x} = \hat{\sigma}(\mathbf{z}) \odot \mathbf{z} + \hat{\mu}(\mathbf{x}).$$

- ▶ Calculating the density $p(\mathbf{x}|\theta)$ - 1 pass.
- ▶ Sampling - m passes.

IAF

$$\mathbf{x} = \sigma(\mathbf{z}) \odot \mathbf{z} + \mu(\mathbf{z}).$$

- ▶ Calculating the density $p(\mathbf{x}|\theta)$ - m passes.
- ▶ Sampling - 1 pass.

RealNVP

$$\mathbf{x}_{1:d} = \mathbf{z}_{1:d};$$

$$\mathbf{x}_{d:m} = \mathbf{z}_{d:m} \odot \exp(c_1(\mathbf{z}_{1:d}, \theta)) + c_2(\mathbf{x}_{1:d}, \theta).$$

MAF vs IAF vs RealNVP

RealNVP

$$\mathbf{x}_{1:d} = \mathbf{z}_{1:d};$$

$$\mathbf{x}_{d:m} = \mathbf{z}_{d:m} \odot \exp(c_1(\mathbf{z}_{1:d}, \theta)) + c_2(\mathbf{x}_{1:d}, \theta).$$

- ▶ Calculating the density $p(\mathbf{x}|\theta)$ - 1 pass.
- ▶ Sampling - 1 pass.

RealNVP is a special case of MAF and IAF:

MAF

$$\begin{cases} \hat{\mu}_i = \hat{\sigma}_i = 0, i = 1, \dots, d; \\ \hat{\mu}_i, \hat{\sigma}_i - \text{functions of } \mathbf{x}_{1:d}, i = d + 1, \dots, m. \end{cases}$$

IAF

$$\begin{cases} \mu_i = \sigma_i = 0, i = 1, \dots, d; \\ \mu_i, \sigma_i - \text{functions of } \mathbf{z}_{1:d}, i = d + 1, \dots, m. \end{cases}$$

MAF/IAF pros and cons

MAF

- ▶ Sampling is slow.
- ▶ Likelihood evaluation is fast.

IAF

- ▶ Sampling is fast.
- ▶ Likelihood evaluation is slow.

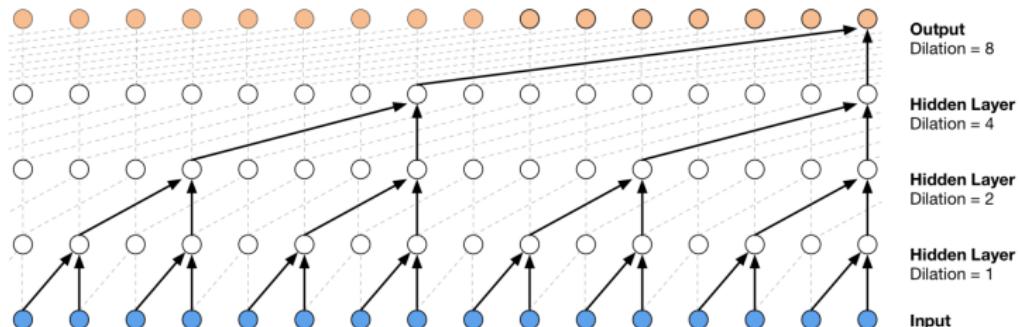

How to take the best of both worlds?

WaveNet (2016)

Autoregressive model for raw audio waveforms generation

$$p(\mathbf{x}|\theta) = \prod_{t=1}^T p(x_t|\mathbf{x}_{1:t-1}, \theta).$$

The model uses causal dilated convolutions.

<https://arxiv.org/pdf/1609.03499.pdf>

Parallel WaveNet, 2017

Previous WaveNet model

- ▶ raw audio is high-dimensional (e.g. 16000 samples per second for 16kHz audio);
- ▶ WaveNet encodes 8-bit signal with 256-way categorical distribution.

Goal

- ▶ improved fidelity (24kHz instead of 16kHz) → increase dilated convolution filter size from 2 to 3;
- ▶ 16-bit signals → mixture of logistics instead of categorical distribution.

<https://arxiv.org/pdf/1711.10433.pdf>

Probability density distillation

1. Train usual WaveNet (MAF) via MLE (teacher network).
2. Train IAF WaveNet model (student network), which attempts to match the probability of its own samples under the distribution learned by the teacher.

Student objective

$$KL(p_s || p_t) = H(p_s, p_t) - H(p_s).$$

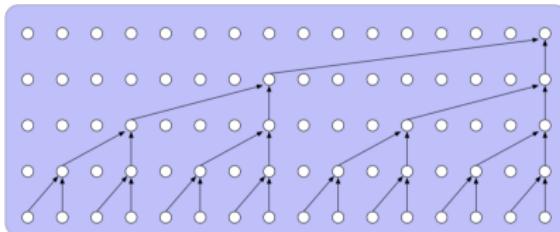

More than 1000x speed-up relative to original WaveNet!

Summary

- ▶ Flows is a continuous model. To use it for discrete distribution, the data should be dequantized.
- ▶ Original VAE model has lot of limitations. One of them is a restricted class of variational posteriors.
- ▶ Using flows in a latent space of VAE could give more flexible posterior distribution.
- ▶ Gaussian autoregressive model is a special type of flow (RealNVP model is a special type of this autoregressive model)
- ▶ MAF is an example of such model which is suitable for density estimation tasks.
- ▶ IAF used the inverse autoregressive transformation for variational inference task.

VAE limitations

- ▶ Poor variational posterior distribution (encoder)

$$q(\mathbf{z}|\mathbf{x}, \phi) = \mathcal{N}(\mathbf{z}|\mu_\phi(\mathbf{x}), \sigma_\phi^2(\mathbf{x})).$$

- ▶ Poor prior distribution

$$p(\mathbf{z}) = \mathcal{N}(0, \mathbf{I}).$$

- ▶ Poor probabilistic model (decoder)

$$p(\mathbf{x}|\mathbf{z}) = \mathcal{N}(\mathbf{x}|\mu_\theta(\mathbf{z}), \sigma_\theta^2(\mathbf{z})).$$

- ▶ Loose lower bound

$$p(\mathbf{x}|\theta) - \mathcal{L}(q, \theta) = (?).$$

Importance Sampling

$$\begin{aligned} p(\mathbf{x}|\boldsymbol{\theta}) &= \int p(\mathbf{x}, \mathbf{z}|\boldsymbol{\theta}) d\mathbf{z} = \int \left[\frac{p(\mathbf{x}, \mathbf{z}|\boldsymbol{\theta})}{q(\mathbf{z}|\mathbf{x})} \right] q(\mathbf{z}|\mathbf{x}) d\mathbf{z} \\ &= \int f(\mathbf{x}, \mathbf{z}) q(\mathbf{z}|\mathbf{x}) d\mathbf{z} = \mathbb{E}_{\mathbf{z} \sim q(\mathbf{z}|\mathbf{x})} f(\mathbf{x}, \mathbf{z}) \end{aligned}$$

Here $f(\mathbf{x}, \mathbf{z}) = \frac{p(\mathbf{x}, \mathbf{z}|\boldsymbol{\theta})}{q(\mathbf{z}|\mathbf{x})}$.

$$\begin{aligned} \log p(\mathbf{x}|\boldsymbol{\theta}) &= \log \mathbb{E}_{\mathbf{z} \sim q(\mathbf{z}|\mathbf{x})} f(\mathbf{x}, \mathbf{z}) \geq \mathbb{E}_{\mathbf{z} \sim q(\mathbf{z}|\mathbf{x})} \log f(\mathbf{x}, \mathbf{z}) = \\ &= \mathbb{E}_{\mathbf{z} \sim q(\mathbf{z}|\mathbf{x})} \log \frac{p(\mathbf{x}, \mathbf{z}|\boldsymbol{\theta})}{q(\mathbf{z}|\mathbf{x})} = \mathcal{L}(q, \boldsymbol{\theta}). \end{aligned}$$

Could we choose better $f(\mathbf{x}, \mathbf{z})$?

Let $f(\mathbf{x}, \mathbf{z}_1, \dots, \mathbf{z}_K) = \frac{1}{K} \sum_{k=1}^K \frac{p(\mathbf{x}, \mathbf{z}_k|\boldsymbol{\theta})}{q(\mathbf{z}_k|\mathbf{x})}$.

$$f(\mathbf{x}, \mathbf{z}_1, \dots, \mathbf{z}_K) = \frac{1}{K} \sum_{k=1}^K \frac{p(\mathbf{x}, \mathbf{z}_k | \theta)}{q(\mathbf{z}_k | \mathbf{x})}$$

$$\begin{aligned}\log p(\mathbf{x} | \theta) &= \log \mathbb{E}_{\mathbf{z}_1, \dots, \mathbf{z}_K \sim q(\mathbf{z} | \mathbf{x})} f(\mathbf{x}, \mathbf{z}, \dots, \mathbf{z}_K) \geq \\ &\geq \mathbb{E}_{\mathbf{z}_1, \dots, \mathbf{z}_K \sim q(\mathbf{z} | \mathbf{x})} \log f(\mathbf{x}, \mathbf{z}, \dots, \mathbf{z}_K) = \\ &= \mathbb{E}_{\mathbf{z}_1, \dots, \mathbf{z}_K \sim q(\mathbf{z} | \mathbf{x})} \log \left[\frac{1}{K} \sum_{k=1}^K \frac{p(\mathbf{x}, \mathbf{z}_k | \theta)}{q(\mathbf{z}_k | \mathbf{x})} \right] = \mathcal{L}_K(q, \theta).\end{aligned}$$

<https://arxiv.org/pdf/1509.00519.pdf>

VAE objective

$$p(\mathbf{x}|\boldsymbol{\theta}) \geq \mathcal{L}(q, \boldsymbol{\theta}) = \mathbb{E}_{q(\mathbf{z}|\mathbf{x})} \log \frac{p(\mathbf{x}, \mathbf{z}|\boldsymbol{\theta})}{q(\mathbf{z}|\mathbf{x})} \rightarrow \max_{\phi, \boldsymbol{\theta}}$$

$$\mathcal{L}(q, \boldsymbol{\theta}) = \mathbb{E}_{\mathbf{z}_1, \dots, \mathbf{z}_K \sim q(\mathbf{z}|\mathbf{x})} \left(\frac{1}{K} \sum_{k=1}^K \log \frac{p(\mathbf{x}, \mathbf{z}_k|\boldsymbol{\theta})}{q(\mathbf{z}_k|\mathbf{x})} \right) \rightarrow \max_{q, \boldsymbol{\theta}}.$$

IWAE objective

$$\mathcal{L}_K(q, \boldsymbol{\theta}) = \mathbb{E}_{\mathbf{z}_1, \dots, \mathbf{z}_K \sim q(\mathbf{z}|\mathbf{x})} \log \left(\frac{1}{K} \sum_{k=1}^K \frac{p(\mathbf{x}, \mathbf{z}_k|\boldsymbol{\theta})}{q(\mathbf{z}_k|\mathbf{x})} \right) \rightarrow \max_{q, \boldsymbol{\theta}}.$$

If $K = 1$, these objectives coincide.

Theorem

1. $\log p(\mathbf{x}|\theta) \geq \mathcal{L}_K(q, \theta) \geq \mathcal{L}_M(q, \theta)$, for $K \geq M$;
2. $\log p(\mathbf{x}|\theta) = \lim_{K \rightarrow \infty} \mathcal{L}_K(q, \theta)$ if $\frac{p(\mathbf{x}, \mathbf{z}|\theta)}{q(\mathbf{z}|\mathbf{x})}$ is bounded.

Proof of 1.

$$\begin{aligned}
\mathcal{L}_K(q, \theta) &= \mathbb{E}_{\mathbf{z}_1, \dots, \mathbf{z}_K} \log \left(\frac{1}{K} \sum_{k=1}^K \frac{p(\mathbf{x}, \mathbf{z}_k | \theta)}{q(\mathbf{z}_k | \mathbf{x})} \right) = \\
&= \mathbb{E}_{\mathbf{z}_1, \dots, \mathbf{z}_K} \log \mathbb{E}_{k_1, \dots, k_M} \left(\frac{1}{M} \sum_{m=1}^M \frac{p(\mathbf{x}, \mathbf{z}_{k_m} | \theta)}{q(\mathbf{z}_{k_m} | \mathbf{x})} \right) \geq \\
&\geq \mathbb{E}_{\mathbf{z}_1, \dots, \mathbf{z}_K} \mathbb{E}_{k_1, \dots, k_M} \log \left(\frac{1}{M} \sum_{m=1}^M \frac{p(\mathbf{x}, \mathbf{z}_{k_m} | \theta)}{q(\mathbf{z}_{k_m} | \mathbf{x})} \right) = \\
&= \mathbb{E}_{\mathbf{z}_1, \dots, \mathbf{z}_M} \log \left(\frac{1}{M} \sum_{m=1}^M \frac{p(\mathbf{x}, \mathbf{z}_m | \theta)}{q(\mathbf{z}_m | \mathbf{x})} \right) = \mathcal{L}_M(q, \theta)
\end{aligned}$$

Theorem

1. $\log p(\mathbf{x}) \geq \mathcal{L}_K(q, \theta) \geq \mathcal{L}_M(q, \theta)$, for $K \geq M$;
2. $\log p(\mathbf{x}) = \lim_{K \rightarrow \infty} \mathcal{L}_K(q, \theta)$ if $\frac{p(\mathbf{x}, \mathbf{z}|\theta)}{q(\mathbf{z}|\mathbf{x})}$ is bounded.

Proof of 2.

Consider r.v. $\xi_K = \frac{1}{K} \sum_{k=1}^K \frac{p(\mathbf{x}, \mathbf{z}_k|\theta)}{q(\mathbf{z}_k|\mathbf{x})}$.

If summands are bounded, then (from the strong law of large numbers)

$$\xi_K \xrightarrow[K \rightarrow \infty]{\text{a.s.}} \mathbb{E}_{q(\mathbf{z}|\mathbf{x})} \frac{p(\mathbf{x}, \mathbf{z}|\theta)}{q(\mathbf{z}|\mathbf{x})} = p(\mathbf{x}|\theta).$$

Hence $\mathcal{L}_K(q, \theta) = \mathbb{E} \log \xi_K$ converges to $\log p(\mathbf{x}|\theta)$ as $K \rightarrow \infty$.

<https://arxiv.org/pdf/1509.00519.pdf>

$$\log p(\mathbf{x}|\boldsymbol{\theta}) \geq \mathcal{L}_K(q, \boldsymbol{\theta}) \geq \mathcal{L}(q, \boldsymbol{\theta})$$

If $K > 1$ the bound could be tighter.

$$\mathcal{L}(q, \boldsymbol{\theta}) = \mathbb{E}_{q(\mathbf{z}|\mathbf{x})} \log \frac{p(\mathbf{x}, \mathbf{z}|\boldsymbol{\theta})}{q(\mathbf{z}|\mathbf{x})};$$

$$\mathcal{L}_K(q, \boldsymbol{\theta}) = \mathbb{E}_{\mathbf{z}_1, \dots, \mathbf{z}_K \sim q(\mathbf{z}|\mathbf{x})} \log \left(\frac{1}{K} \sum_{k=1}^K \frac{p(\mathbf{x}, \mathbf{z}_k|\boldsymbol{\theta})}{q(\mathbf{z}_k|\mathbf{x})} \right).$$

- ▶ $\mathcal{L}_1(q, \boldsymbol{\theta}) = \mathcal{L}(q, \boldsymbol{\theta})$;
- ▶ $\mathcal{L}_\infty(q, \boldsymbol{\theta}) = \log p(\mathbf{x}|\boldsymbol{\theta})$.

Which $q(\mathbf{z}|\mathbf{x})$ gives $\mathcal{L}(q, \boldsymbol{\theta}) = \log p(\mathbf{x}|\boldsymbol{\theta})$?

Which $q(\mathbf{z}|\mathbf{x})$ gives $\mathcal{L}(q, \boldsymbol{\theta}) = \mathcal{L}_K(q, \boldsymbol{\theta})$?

Theorem

The VAE objective is equal to IWAE objective

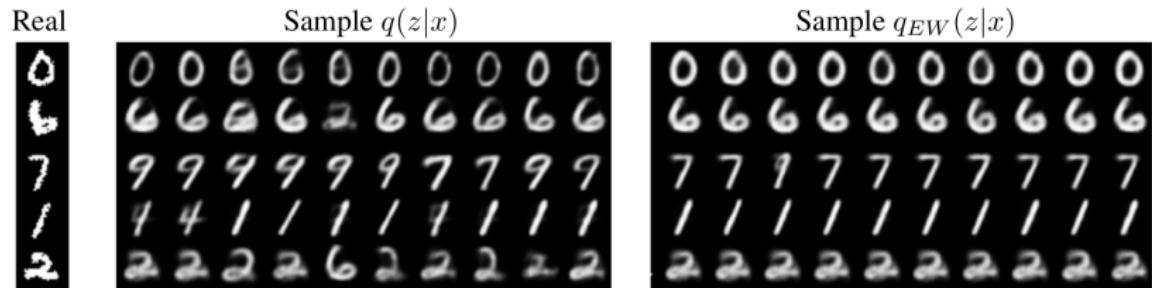

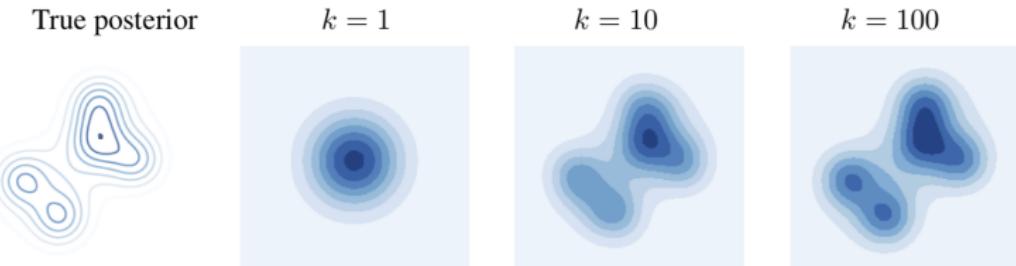

$$\mathcal{L}(q_{EW}, \theta) = \mathcal{L}_K(q, \theta)$$

for the following variational distribution

$$q_{EW}(\mathbf{z}|\mathbf{x}) = \mathbb{E}_{\mathbf{z}_2, \dots, \mathbf{z}_K \sim q(\mathbf{z}|\mathbf{x})} q_{IW}(\mathbf{z}|\mathbf{x}, \mathbf{z}_{2:K}),$$

where

$$q_{IW}(\mathbf{z}|\mathbf{x}, \mathbf{z}_{2:K}) = \frac{\frac{p(\mathbf{x}, \mathbf{z})}{q(\mathbf{z}|\mathbf{x})}}{\frac{1}{K} \sum_{k=1}^K \frac{p(\mathbf{x}, \mathbf{z}_k)}{q(\mathbf{z}_k|\mathbf{x})}} q(\mathbf{z}|\mathbf{x}) = \frac{p(\mathbf{x}, \mathbf{z})}{\frac{1}{K} \left(\frac{p(\mathbf{x}, \mathbf{z})}{q(\mathbf{z}|\mathbf{x})} + \sum_{k=2}^K \frac{p(\mathbf{x}, \mathbf{z}_k)}{q(\mathbf{z}_k|\mathbf{x})} \right)}.$$

<https://openreview.net/pdf?id=Syw2ZgrFx>

How to determine whether all VAE latent variables are informative?

$$A_i = \text{cov}_{\mathbf{x}} (\mathbb{E}_{q(z_i|\mathbf{x})}[z_i]) > 0.01 \Leftrightarrow z_i \text{ is active}$$

ELBO surgery, 2016

ELBO interpretations

- ▶ Evidence minus posterior KL

$$\mathcal{L}(q, \theta) = \log p(\mathbf{X}|\theta) + KL(q(\mathbf{Z}|\mathbf{X})||p(\mathbf{Z}|\mathbf{X}, \theta)).$$

- ▶ Average negative energy plus entropy

$$\mathcal{L}(q, \theta) = \mathbb{E}_{q(\mathbf{Z}|\mathbf{X})} p(\mathbf{X}, \mathbf{Z}|\theta) + \mathbb{H}[q(\mathbf{Z}|\mathbf{X})].$$

- ▶ Average term-by-term reconstruction minus KL to prior

$$\mathcal{L}(q, \theta) = \frac{1}{n} \sum_{i=1}^n [\mathbb{E}_{q(\mathbf{z}_i|\mathbf{x}_i)} \log p(\mathbf{x}_i|\mathbf{z}_i, \theta) - KL(q(\mathbf{z}_i|\mathbf{x}_i)||p(\mathbf{z}_i))].$$

ELBO surgery, 2016

$$\mathcal{L}(q, \theta) = \frac{1}{n} \sum_{i=1}^n [\mathbb{E}_{q(\mathbf{z}_i|\mathbf{x}_i)} \log p(\mathbf{x}_i|\mathbf{z}_i, \theta) - KL(q(\mathbf{z}_i|\mathbf{x}_i)||p(\mathbf{z}_i))].$$

Theorem

$$\frac{1}{n} \sum_{i=1}^n KL(q(\mathbf{z}_i|\mathbf{x}_i)||p(\mathbf{z}_i)) = KL(q(\mathbf{z})||p(\mathbf{z})) + \mathbb{I}_{q(i,\mathbf{z})}[i, \mathbf{z}],$$

where i is treated as random variable:

$$q(i, \mathbf{z}) = q(i)q(\mathbf{z}|i); \quad p(i, \mathbf{z}) = p(i)p(\mathbf{z}); \quad q(i) = p(i) = \frac{1}{n}; \quad q(\mathbf{z}|i) = q(\mathbf{z}|\mathbf{x}_i).$$

$$q(\mathbf{z}) = \sum_{i=1}^n q(i, \mathbf{z}) = \frac{1}{n} \sum_{i=1}^n q(\mathbf{z}|\mathbf{x}_i); \quad \mathbb{I}_{q(i,\mathbf{z})}[i, \mathbf{z}] = \mathbb{E}_{q(i,\mathbf{z})} \log \frac{q(i, \mathbf{z})}{q(i)q(\mathbf{z})}.$$

ELBO surgery, 2016

Theorem

$$\frac{1}{n} \sum_{i=1}^n KL(q(\mathbf{z}_i | \mathbf{x}_i) || p(\mathbf{z}_i)) = KL(q(\mathbf{z}) || p(\mathbf{z})) + \mathbb{I}_{q(i, \mathbf{z})}[i, \mathbf{z}].$$

Proof

$$\begin{aligned}\frac{1}{n} \sum_{i=1}^n KL(q(\mathbf{z}_i | \mathbf{x}_i) || p(\mathbf{z}_i)) &= \sum_{i=1}^n \int q(i) q(\mathbf{z}|i) \log \frac{q(\mathbf{z}|i)}{p(\mathbf{z})} d\mathbf{z} = \\&= \sum_{i=1}^n \int q(i, \mathbf{z}) \log \frac{q(i, \mathbf{z})}{p(\mathbf{z})p(i)} d\mathbf{z} = \int \sum_{i=1}^n q(i, \mathbf{z}) \log \frac{q(\mathbf{z})q(i|\mathbf{z})}{p(\mathbf{z})p(i)} d\mathbf{z} = \\&= \int q(\mathbf{z}) \log \frac{q(\mathbf{z})}{p(\mathbf{z})} d\mathbf{z} + \int \sum_{i=1}^n q(i|\mathbf{z})q(\mathbf{z}) \log \frac{q(i|\mathbf{z})}{p(i)} d\mathbf{z} = \\&= KL(q(\mathbf{z}) || p(\mathbf{z})) - \mathbb{E}_{q(\mathbf{z})} \mathbb{H}[q(i|\mathbf{z})] + \log N.\end{aligned}$$

ELBO surgery, 2016

Theorem

$$\frac{1}{n} \sum_{i=1}^n KL(q(\mathbf{z}_i | \mathbf{x}_i) || p(\mathbf{z}_i)) = KL(q(\mathbf{z}) || p(\mathbf{z})) + \mathbb{I}_{q(i, \mathbf{z})}[i, \mathbf{z}].$$

Proof (continued)

$$\frac{1}{n} \sum_{i=1}^n KL(q(\mathbf{z}_i | \mathbf{x}_i) || p(\mathbf{z}_i)) = KL(q(\mathbf{z}) || p(\mathbf{z})) - \mathbb{E}_{q(\mathbf{z})} \mathbb{H}[q(i|\mathbf{z})] + \log N$$

$$\begin{aligned}\mathbb{I}_{q(i, \mathbf{z})}[i, \mathbf{z}] &= \mathbb{E}_{q(i, \mathbf{z})} \log \frac{q(i, \mathbf{z})}{q(i)q(\mathbf{z})} = \mathbb{E}_{q(\mathbf{z})} \mathbb{E}_{q(i|\mathbf{z})} \log \frac{q(i|\mathbf{z})q(\mathbf{z})}{q(i)q(\mathbf{z})} = \\ &= \mathbb{E}_{q(\mathbf{z})} \mathbb{E}_{q(i|\mathbf{z})} \log \frac{q(i|\mathbf{z})}{q(i)} = -\mathbb{E}_{q(\mathbf{z})} \mathbb{H}[q(i|\mathbf{z})] + \log N.\end{aligned}$$

ELBO surgery, 2016

Theorem

$$\frac{1}{n} \sum_{i=1}^n KL(q(\mathbf{z}_i | \mathbf{x}_i) || p(\mathbf{z}_i)) = KL(q(\mathbf{z}) || p(\mathbf{z})) + \mathbb{I}_{q(i, \mathbf{z})}[i, \mathbf{z}].$$

ELBO revisiting

$$\begin{aligned}\mathcal{L}(q, \theta) &= \frac{1}{n} \sum_{i=1}^n [\mathbb{E}_{q(\mathbf{z}_i | \mathbf{x}_i)} \log p(\mathbf{x}_i | \mathbf{z}_i, \theta) - KL(q(\mathbf{z}_i | \mathbf{x}_i) || p(\mathbf{z}_i))] = \\ &= \frac{1}{n} \sum_{i=1}^n \mathbb{E}_{q(\mathbf{z}_i | \mathbf{x}_i)} \log p(\mathbf{x}_i | \mathbf{z}_i, \theta) - \mathbb{I}_{q(i, \mathbf{z})}[i, \mathbf{z}] - KL(q(\mathbf{z}) || p(\mathbf{z})) = \\ &= \underbrace{\frac{1}{n} \sum_{i=1}^n \mathbb{E}_{q(\mathbf{z}_i | \mathbf{x}_i)} \log p(\mathbf{x}_i | \mathbf{z}_i, \theta)}_{\text{Reconstruction loss}} - \underbrace{(\log N - \mathbb{E}_{q(\mathbf{z})} \mathbb{H}[q(i | \mathbf{z})])}_{0 \leq \text{Mutual info} \leq \log N} - \underbrace{KL(q(\mathbf{z}) || p(\mathbf{z}))}_{\text{Marginal KL}}\end{aligned}$$

ELBO surgery, 2016

ELBO revisiting

$$\mathcal{L}(q, \theta) = \underbrace{\frac{1}{n} \sum_{i=1}^n \mathbb{E}_{q(\mathbf{z}_i | \mathbf{x}_i)} \log p(\mathbf{x}_i | \mathbf{z}_i, \theta)}_{\text{Reconstruction loss}} - \underbrace{(\log N - \mathbb{E}_{q(\mathbf{z})} \mathbb{H}[q(i|\mathbf{z})])}_{0 \leq \text{Mutual info} \leq \log N} - \underbrace{KL(q(\mathbf{z}) || p(\mathbf{z}))}_{\text{Marginal KL}}$$

$$KL(q(\mathbf{z}) || p(\mathbf{z})) = 0 \iff p(\mathbf{z}) = q(\mathbf{z}) = \frac{1}{n} \sum_{i=1}^n q(\mathbf{z} | \mathbf{x}_i).$$

	ELBO	Avg. KL	Mutual info. ②	Marg. KL ③
2D latents	-129.63	7.41	7.20	0.21
10D latents	-88.95	19.17	10.82	8.35
20D latents	-87.45	20.2	10.67	9.53

$$\log N \approx 11.0021$$

VAE prior

ELBO revisiting

$$\mathcal{L}(q, \theta) = \underbrace{\frac{1}{n} \sum_{i=1}^n \mathbb{E}_{q(\mathbf{z}_i|\mathbf{x}_i)} \log p(\mathbf{x}_i|\mathbf{z}_i, \theta)}_{\text{Reconstruction loss}} - \underbrace{(\log N - \mathbb{E}_{q(\mathbf{z})} \mathbb{H}[q(i|\mathbf{z})])}_{0 \leq \text{Mutual info} \leq \log N} - \underbrace{KL(q(\mathbf{z})||p(\mathbf{z}))}_{\text{Marginal KL}}$$

How to choose the optimal $p(\mathbf{z})$?

- ▶ SG: $p(\mathbf{z}) = \mathcal{N}(0, I)$ \Rightarrow over-regularization;
- ▶ MoG: $p(\mathbf{z}|\lambda) = \frac{1}{K} \sum_{k=1}^K \mathcal{N}(\mu_k, \sigma_k^2)$ \Rightarrow (*), (**);
- ▶ $p(\mathbf{z}) = q(\mathbf{z}) = \frac{1}{n} \sum_{i=1}^n q(\mathbf{z}|\mathbf{x}_i)$ \Rightarrow overfitting and highly expensive.

(*) <https://arxiv.org/abs/1611.02648>

(**) <https://pdfs.semanticscholar.org/f6fe/5e8e25994c188ba6a124462e2cc55f2c5a67.pdf>

Variational Mixture of posteriors

$$p(\mathbf{x}|\boldsymbol{\lambda}) = \frac{1}{K} \sum_{k=1}^K q(\mathbf{z}|\mathbf{u}_k),$$

where $\mathbf{u}_1, \dots, \mathbf{u}_K$ is trainable pseudo-inputs.

- ▶ Multimodal \Rightarrow prevents over-regularization;.
- ▶ $K \ll n \Rightarrow$ prevents from potential overfitting + less expensive to train.
- ▶ Pseudo-inputs are prior hyperparameters \Rightarrow connection to the Empirical Bayes.

<https://arxiv.org/pdf/1705.07120.pdf>

VampPrior, 2017

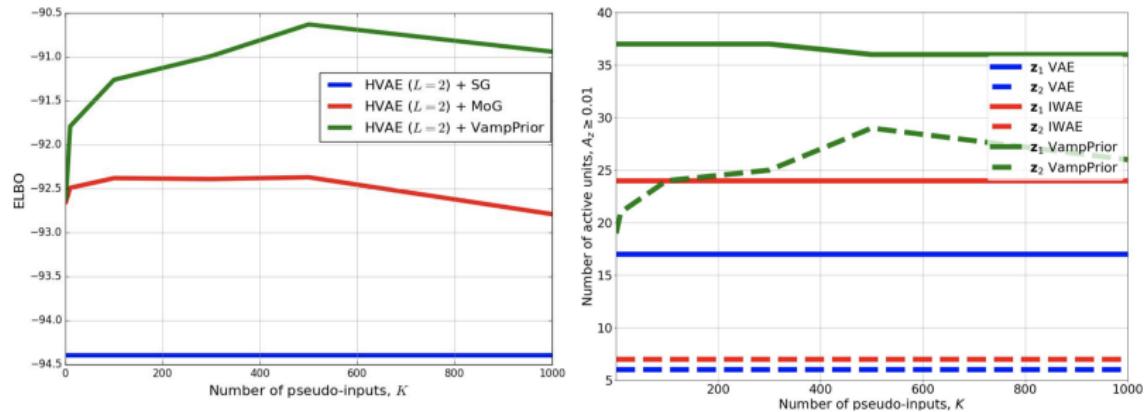

Do we equally need the multimodal prior?

Is it beneficial to couple the prior with the variational posterior or MoG is enough?

<https://arxiv.org/abs/1606.04934>
Summary: Introduce inverse autoregressive flow (IAF). Models each autoregressive conditional as gaussian with autoregressive means and covariances. Inverse transformation allows to parallelize sampling.
- ▶ **MAF:** Masked Autoregressive Flow for Density Estimation
<https://arxiv.org/pdf/1705.07057.pdf>
Summary: Similar to IAF. Give comprehensive overview with link to IAF and RealNVP. MAF is suitable for density estimation, IAF as a recognition network.
- ▶ **Parallel WaveNet:** Fast High-Fidelity Speech Synthesis
<https://arxiv.org/pdf/1711.10433.pdf>
Summary: WaveNet is MAF (sequential generation). To exploit IAF fast sampling, knowledge distillation used. Teacher network is large WaveNet, student - is a IAF small WaveNet (generate samples from noise is parallel). The loss is KL divergence between student and teacher distributions. The additional perceptual, contrastive and power losses used to create more natural sounds.
- ▶ **IWAE:** Importance Weighted Autoencoders
<https://arxiv.org/pdf/1509.00519.pdf>
Summary: Propose the version of ELBO which is tighter to the log-density. Sampling of k objects from latent space instead of one. The more samples we samples the more tight the gap is. In the limit we will get the true likelihood. The gradient is given by importance sampling reweighting. Analyze the number of active latent units.
- ▶ Reinterpreting Importance-Weighted Autoencoders
<https://arxiv.org/abs/1704.02916>
Summary: IWAE maximizes a tighter ELBO than VAE ELBO. This ELBO is also related to some implicit variational distribution. The analytical form of this distribution is given and visualized.
- ▶ **ELBO surgery:** yet another way to carve up the variational evidence lower bound
<http://approximateinference.org/accepted/HoffmanJohnson2016.pdf>
Summary: Propose the decomposition of standard ELBO into 3 terms. The prior distribution should be close to average posterior. Show empirically that weak prior has a significant impact on ELBO value.
- ▶ **VAE with a VampPrior**
<https://arxiv.org/pdf/1705.07120.pdf>
Summary: Variational Mixture of Posteriors prior is introduced. The VampPrior components are given by variational posteriors conditioned on learnable pseudo inputs. Prior is extended to a two layer hierarchical model with a coupled prior and posterior. It
